

*eGEMs* is AcademyHealth’s peer-reviewed, open access journal created to accelerate research and quality improvement using electronic health data. Launched in 2013, *eGEMs* has published hundreds of papers featuring cutting-edge work from leaders in the field and is a premier journal for approaches to redesigning the health system.

## Why Publish with *eGEMs*

*eGEMs* fills a unique void – helping readers understand how we learn from health data with a focus on the nuts-and-bolts of conducting analysis with health data and digging into the real world lessons gleaned by colleagues using these tools right now to improve health and health care.

With readers from around the world including health services and systems researchers, clinicians, data scientists, policymakers, patient advocates, and other health system stakeholders, *eGEMs* papers are helping transform how health care is delivered by digging into the real world lessons of those on the front lines.

## What Makes *eGEMs* Special

While researchers have always been able to share study results through existing peer-reviewed journals, the brilliance behind those results is often left in the shadows. *eGEMs* brings those lessons to light so that readers can understand how the data and methods were used and how they could be replicated or adapted.

## How to Get Involved

If you’re working with electronic health data, consider submitting to *eGEMs* or sponsoring a special issue of the journal to raise awareness about your expertise in the field of electronic health data.
